if the temporally closest anchor frame is subsequent to the predicted frame, to utilize even-parity field prediction to only unidirectionally backward predict content of each of a plurality of fields of the unidirectionally backward predicted frame from corresponding fields of only the temporally closest anchor frame in the stream of data;

wherein the unidirectionally predicted frame that is predicted only from the temporally closest anchor frame comprises a frame that is defined as a bi-directionally predicted frame according to an encoding protocol for the stream of data as specified in claim 12.
